NIAT Growth Challenge Reflection

Layer 4 | Personal reflection

What I learned about myself

I learned that I can move quickly from research to a working growth system, but speed makes verification more important, not less. My first live AI draft added accreditation and facility claims about a fictional university that I had never supplied or checked. I caught that in the reviewer flow, replaced those claims with exact case inputs and sourced NIAT facts, and kept AI focused on questions that a counsellor must answer. That experience changed how I think about AI in growth: it is useful for organizing decisions, but I am responsible for every claim a family sees.

My rating and why

I would rate this submission 9/10. The audit distinguished NIAT's upskilling from the university degree and traced its visible funnel. The proposed Parent Decision Brief has a clear audience, a 14-day test, and an explicit payment metric; the 10% to 16% lift is a hypothesis, not a result. I also shipped a public prototype connecting source checks, AI review, approval, family questions, and call booking. I take off one point because it uses fictional offers and demo slots. Without NIAT's verified fees, counsellor calendars, admissions and payment data, I cannot claim that it improves real enrollment.
